

## Project Description of Group 8

### **Team Name and Roll No.**

Lakshya Agrawal — 2415000885

Mayank Kumar — 2415000957

Lucky Sinha — 2415000905

Lavanya Jain — 2415000893

### **Objective**

The objective of this project is to design and develop a simple, web-based Job and Internship Management Portal using HTML and CSS that brings job and internship listings together on a single platform. The portal aims to display job categories, available jobs, internship opportunities, and company information in an organized layout, while offering a basic search facility based on job title, skills, and location. It also seeks to provide a clean, responsive, and user-friendly interface that helps students and freshers explore career opportunities easily, and to strengthen the team's practical understanding of front-end web development.

### **Description**

Finding suitable jobs and internships is often a time-consuming task for students, since relevant information is scattered across multiple websites and platforms, each with its own format and structure. This makes it difficult for freshers to compare opportunities based on criteria such as company name, location, salary, duration, and required skills. The Job and Internship Management Portal addresses this problem by bringing such information together into a single, easy-to-navigate website.

The portal is built entirely using HTML and CSS, with HTML forming the structural backbone of the site and CSS handling its visual design, including colors, fonts, spacing, buttons, and card-based layouts. The website is organized into distinct sections, namely Home, Job Categories, Available Jobs, Internship Opportunities, Companies, and About, each accessible through a navigation menu. Job and internship listings are presented as individual cards displaying key details, allowing users to scan opportunities quickly and compare them at a glance.

A basic search section is included on the home page, letting users filter opportunities by entering a job title, required skill, or preferred location. As this is an introductory HTML and CSS project, all displayed data is static rather than being pulled from a live database, and the system architecture follows a straightforward flow in which the user moves from the home page to search or category selection and then to detailed job, internship, or company information.

The project follows a phased implementation plan covering initial planning, HTML structuring, CSS styling, content population, testing across the site's navigation and layout, and a final round of design refinement. By the end of the project, the team expects to deliver a functional, visually clean, and responsive portal that demonstrates the core sections of a job-search platform. Beyond the deliverable itself, the project is intended to deepen the team's practical skills in semantic HTML and CSS layout techniques, laying the groundwork for future enhancements such as JavaScript-based interactivity, database integration, user authentication, and an administrative panel for managing listings.
