Abstract

The **Job and Internship Management Portal** is a simple web-based project designed to help students and job seekers find suitable job and internship opportunities in one place. The main purpose of this project is to make the process of searching for jobs and internships easier and more organized.

The website provides different sections such as job categories, available jobs, internship opportunities, companies hiring and information about the portal. Users can search for jobs according to job title, skills and location. The project is developed using **HTML and CSS**, where HTML is used to create the structure of the website and CSS is used to design and style the web pages.

The expected outcome of this project is a simple, attractive and user-friendly portal that provides useful information about different career opportunities.

Keywords

HTML, CSS, Job Portal, Internship Portal, Web Development, Job Management, Career Opportunities

1. Introduction

Finding a suitable job or internship can be difficult for students and freshers because job opportunities are available on different websites and platforms. Students often have to spend a lot of time searching for suitable opportunities according to their skills and location.

The **Job and Internship Management Portal** is developed to provide job and internship information through a single website. The project contains different sections for jobs, internships, job categories and companies.

The website is designed using basic web development technologies. **HTML** is used to create the structure and content of the website, while **CSS** is used to improve its appearance and layout.

The main focus of this project is to create a simple and easy-to-use interface that can help students understand and explore different career opportunities.

2. Problem Statement

Students and freshers often face difficulty while searching for suitable jobs and internships. Information about different opportunities is usually available on different websites, making the searching process time-consuming.

There is a need for a simple platform where users can view job and internship opportunities along with important information such as company name, location, salary, duration and required skills.

The proposed **Job and Internship Management Portal** aims to provide this information in a simple and organized web interface.

3. Objectives

The main objectives of the project are:

1. To create a simple web-based job and internship portal.
2. To provide information about available jobs and internships.
3. To organize job opportunities according to different categories.
4. To provide basic search options for jobs and internships.
5. To display company and job-related information clearly.
6. To create a simple and user-friendly website interface.
7. To improve understanding of HTML and CSS through practical implementation.
8. To create a responsive layout that can be viewed on different screen sizes.

4. Literature Review

Various online platforms are available for searching jobs and internships. These platforms provide information about job roles, companies, locations and required skills. However, many professional platforms contain a large number of features which can sometimes make them complex for beginners and students.

Existing job portals generally provide features such as job searching, company

information, job categories and application options. These concepts were considered while planning the proposed project.

The **Job and Internship Management Portal** focuses mainly on creating a simple interface for students and beginners. The project takes basic ideas from existing job portals and implements them using HTML and CSS.

5. Proposed Methodology

The project will be developed as a basic web application using **HTML and CSS**.

HTML will be used to create different sections of the website such as:

- Home
- Job Categories
- Available Jobs
- Internship Opportunities
- Companies
- About
- Footer

CSS will be used to design the website. It will be used for colors, fonts, spacing, buttons, borders, cards and page layout.

The website will contain job cards and internship cards where basic information such as company name, location, salary, duration and skills will be displayed.

A basic search area will also be provided on the home page where users can enter a job title, skill or location.

6. System Architecture

The basic architecture of the proposed system consists of the following components:

User

Job and Internship Portal

Home Page

Search / Job Categories

Job & Internship Information

Company Information

The user first visits the portal and views the home page. From the navigation menu, the user can move to different sections such as Jobs, Internships, Companies and About.

The job section displays available jobs with their basic details. Similarly, the internship section displays available internship opportunities.

Since this is an initial HTML and CSS project, the information displayed on the website is currently static.

7. Implementation Plan

The project will be implemented in different stages.

Phase 1 – Planning

In the first phase, the basic idea and requirements of the project will be discussed. The different sections of the website will be planned.

Phase 2 – HTML Development

HTML will be used to create the basic structure of the website. Navigation bar, headings, paragraphs, forms, buttons and job cards will be created.

Phase 3 – CSS Designing

CSS will be added to improve the appearance of the website. Colors, fonts, spacing,

borders and layouts will be designed.

Phase 4 – Content Addition

Job information, internship information and company names will be added to the website.

Phase 5 – Testing

The website will be opened in a web browser and different sections, navigation links and layouts will be checked.

Phase 6 – Final Improvements

After testing, basic design and layout problems will be corrected and the final version of the website will be prepared.

8. Expected Results

The expected result of this project is a simple and user-friendly **Job and Internship Management Portal**.

The website will:

- Display available job opportunities.
- Display internship opportunities.
- Show different job categories.
- Provide basic company information.
- Provide a search section.
- Provide navigation between different sections.
- Have a clean and organized design.
- Help students understand the basic process of creating a web-based portal.

The project will also help the team gain practical knowledge of **HTML and CSS** and improve their basic web development skills.

9. Conclusion

The Job and Internship Management Portal is a basic web development project created to provide job and internship information in an organized manner. The project focuses on creating a simple interface that can be easily understood and used by students and freshers.

HTML is used for creating the structure of the website and CSS is used for designing and formatting the different sections. Through this project, the team will gain practical experience in creating web pages, designing layouts and organizing information.

In the future, the project can be improved by adding JavaScript, a database, user login, job application functionality and an admin panel.
